

# Collapsible spill bund ECCOTARP ET

This collapsible spill bund is designed for a quick response to accidental leaks of water, oil-based products and chemicals. Unlike plastic or metal containers it has the advantage of fitting round any object, regardless of shape. The steel cables coated with PVC which pass through the stainless steel hooks are specially designed for handling the bund. The maximum permissible weight is 200 kg. Each product is provided with a built-in level indicator to show the quantity of retrieved liquid. The protective pad and special liner which are delivered as accessories considerably enhance the durability of the spill bund.

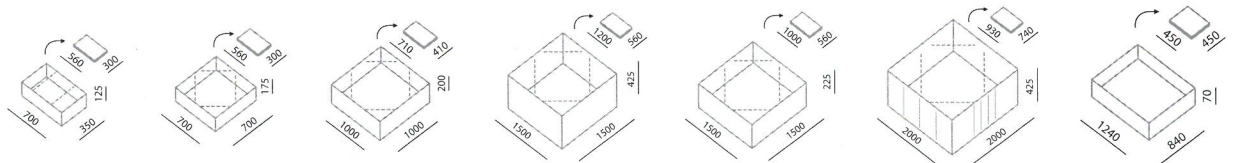

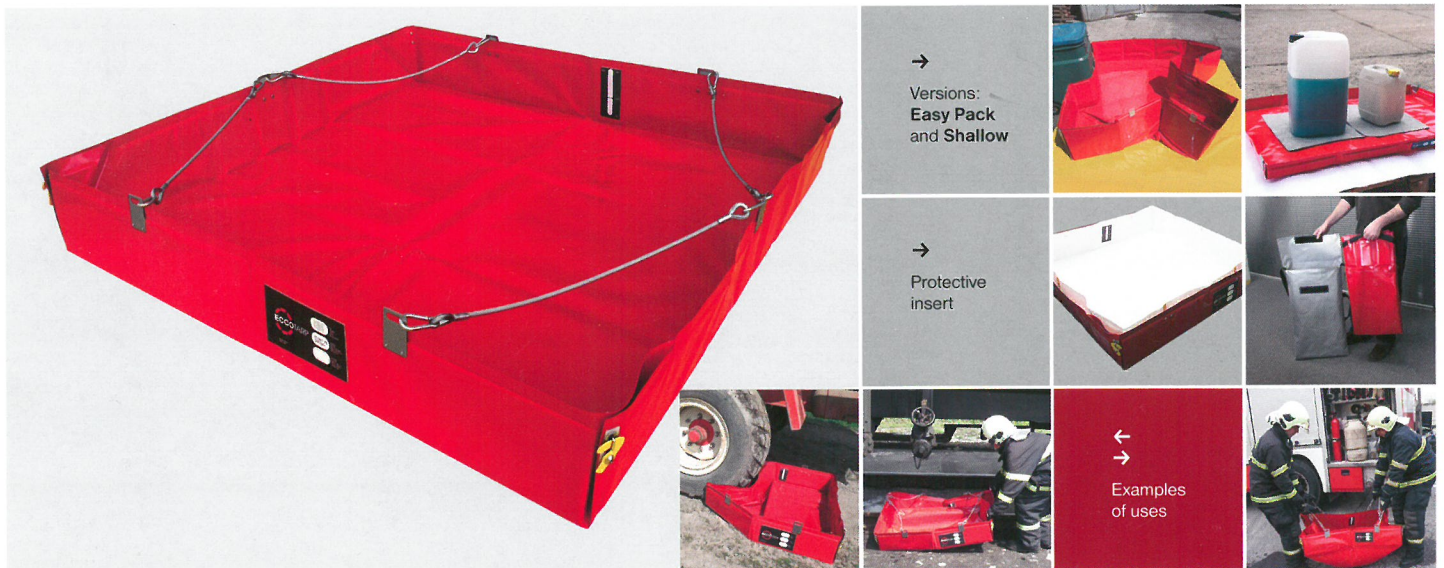

The portable spill bund is intended for short-term storage of retrieved liquids in emergencies. Thanks to its simple assembly and easy handling the bund is immediately ready to be used even in inaccessible areas. The spill bunds are delivered in several sizes. It is also possible to use the bigger models both as large volume containers and to capture spills when siphoning fuel from refuelling trucks.

The XL DECON spill bund with its lower sidewalls is especially suitable for emergency decontamination of people. The reinforcements in the sidewalls of the EASY PACK are multi-segmented, so the bund folds better around any obstacle and it can be folded into a smaller pack. The SHALLOW version with its extremely low profile design can either be used in inaccessible areas, especially in narrow spaces with low headroom, or as a spill collecting tray to ensure safe filling and emptying of vessels.

Due to reinforcements in the side walls the spill bunds are rigid and self-supporting. They are made from thick fabric with a protective proofing layer (PES/PVC 680 g/m<sup>2</sup>). They are resistant to oil-based substances, acids and alkalis at temperatures between -30°C and +70°C.
